for introductory courses in differential equations this text provides the conceptual development and geometric visualization of a modern differential equations course while maintaining the solid foundation of algebraic techniques that are still essential to science and engineering students it reflects the new excitement in differential equations as the availability of technical computing environments likemaple mathematica and matlab reshape the role and applications of the discipline new technology has motivated a shift in emphasis from traditional manual methods to both qualitative and computer based methods that render accessible a wider range of realistic applications with this in mind the text augments core skills with conceptual perspectives that students will need for the effective use of differential equations in their subsequent work and study

for briefer traditional courses in elementary differential equations that science engineering and mathematics students take following calculus this accessible attractive and interesting text teaches students to first solve those differential equations that have the most frequent and interesting applications this motivates students and illustrates the standard elementary techniques of solution of differential equations precise and clear cut statements of fundamental existence and uniqueness theorems allow understanding of their role in this subject the first few sections of most chapters introduce the principle ideas of each topic with remaining sections devoted to extensions and applications giving instructors a wide range of choices regarding breadth and depth of coverage a strong numerical approach emphasizes that the effective and reliable use of numerical methods often requires preliminary analysis using standard elementary techniques

edwards and penney provide enough material for two terms in this accessible text for students taking traditional courses in elementary differential equations without the use of computers
